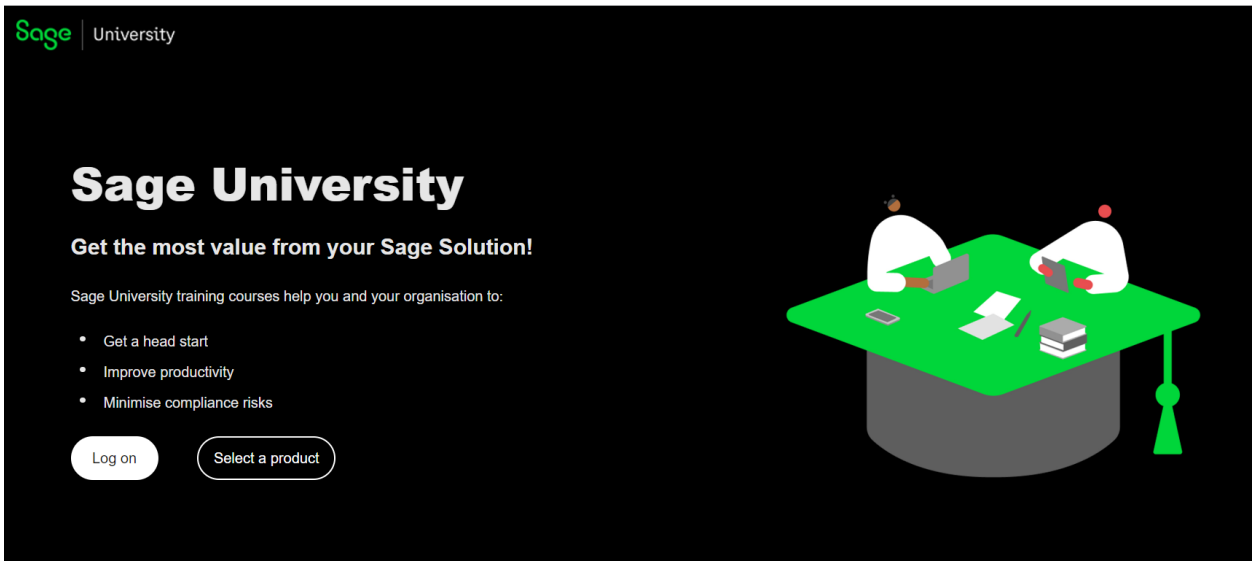
Sage 200 Evolution Data Files

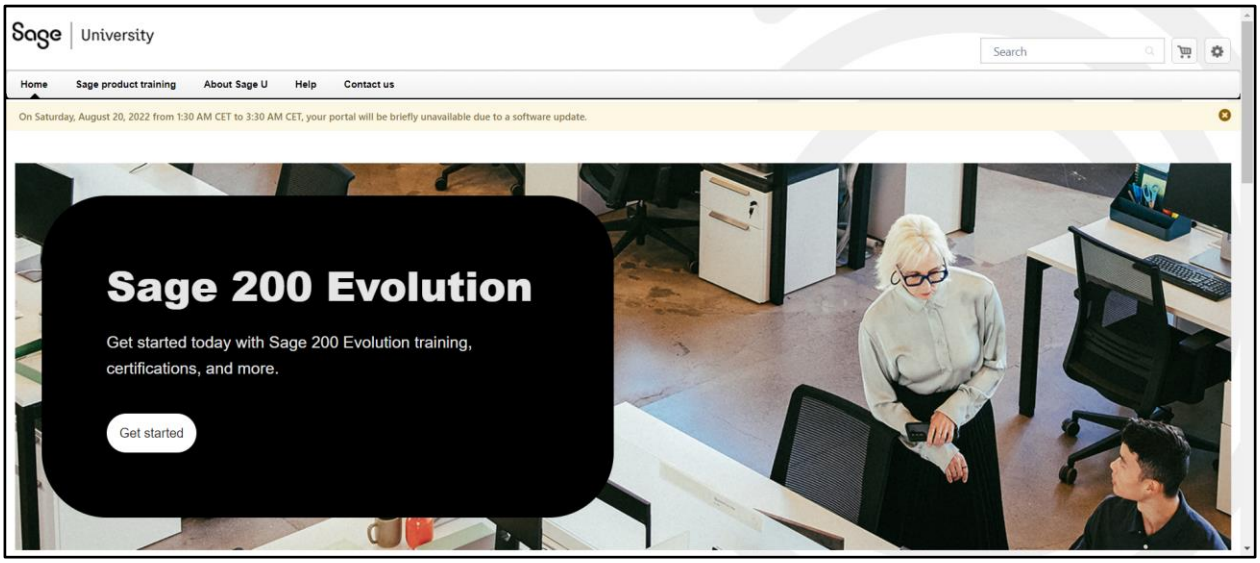
The Sage 200 Evolution data files for this course can be located on Sage University. If you do not have a Sage University account, follow all the steps. If you have an account continue from step 7:

1. Access the internet and enter the following address: http://sageu.com/en-za/home.html
2. Click on the **Select a product** button.

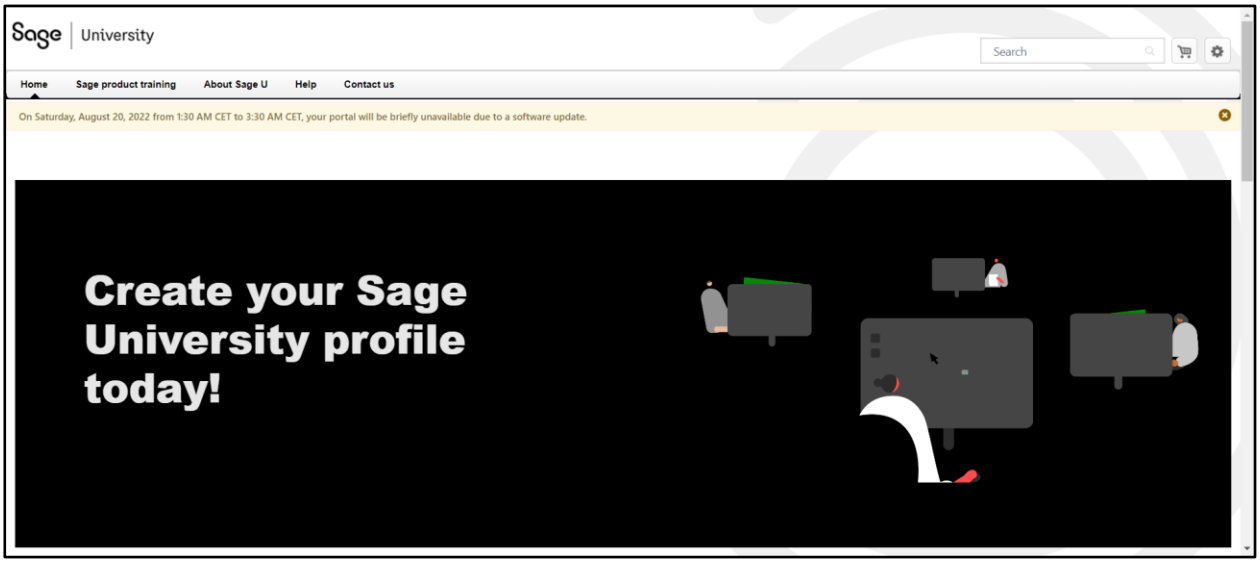


3. The following screen will display:

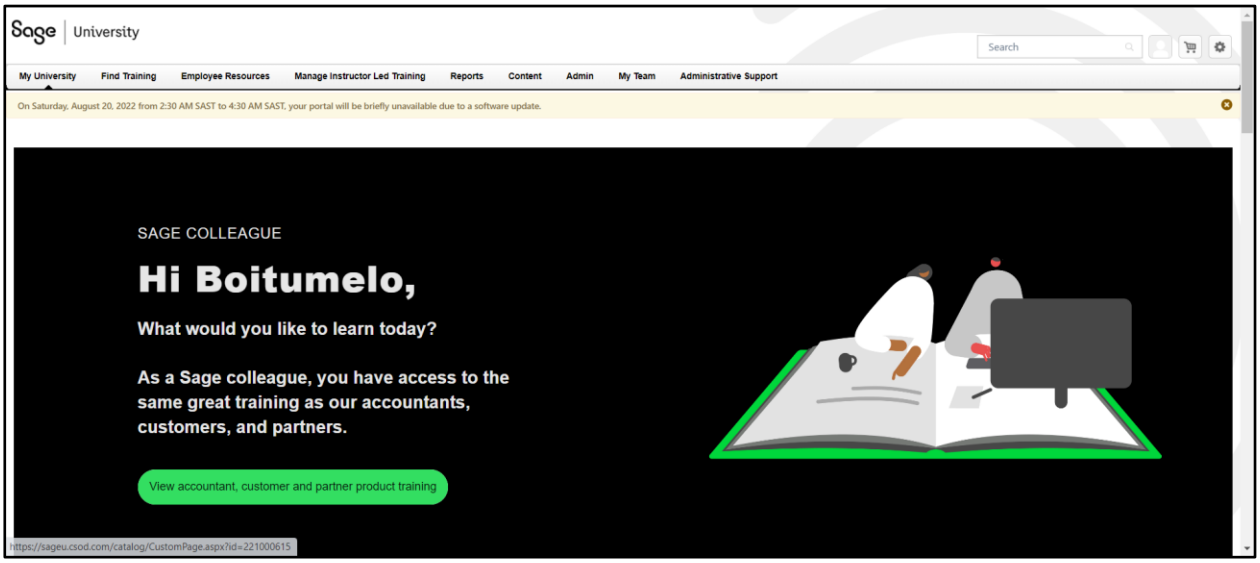
4. Select the **Sage 200** button. The following screen will display:



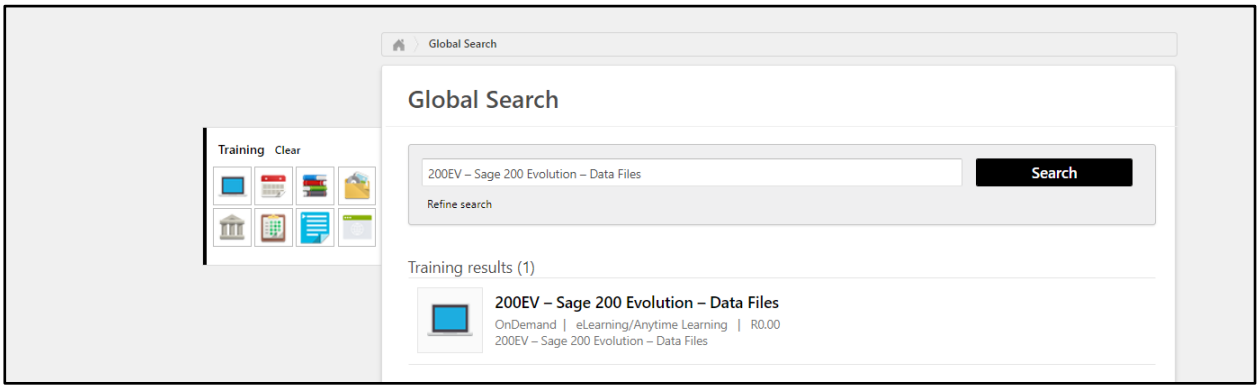
5. Click on the **Create a profile** button. The following screen will display:



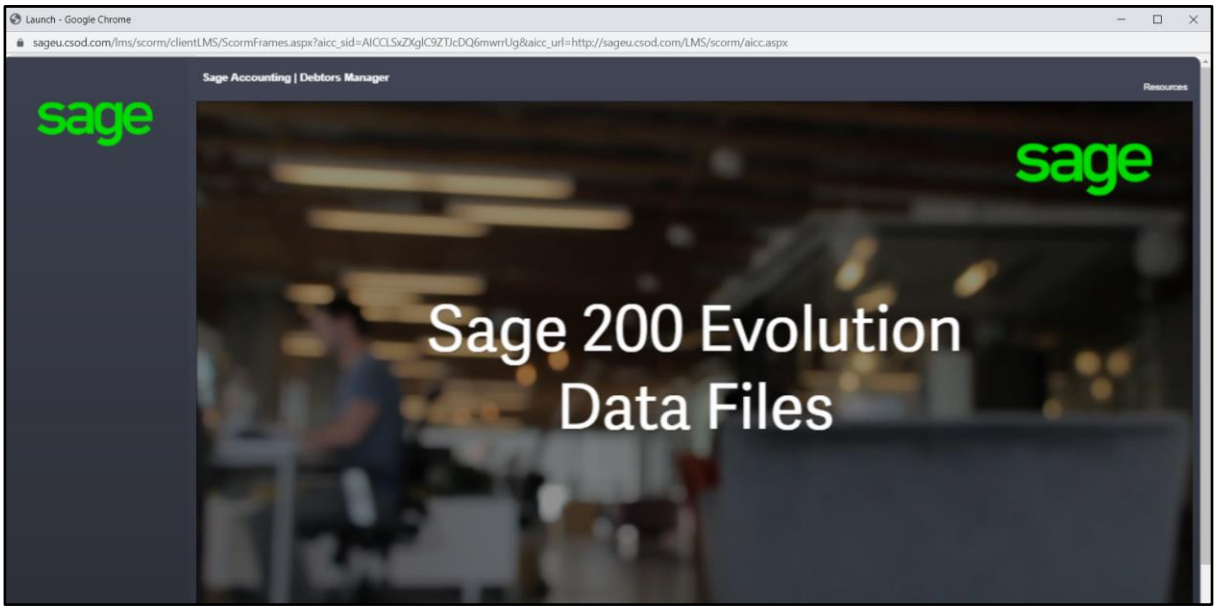
6. Enter your details and click on the **Log In** button at the bottom of the page.
7. If you already have an account, simply click on the **Log In** button at the top of the page.
8. The following screen will display:



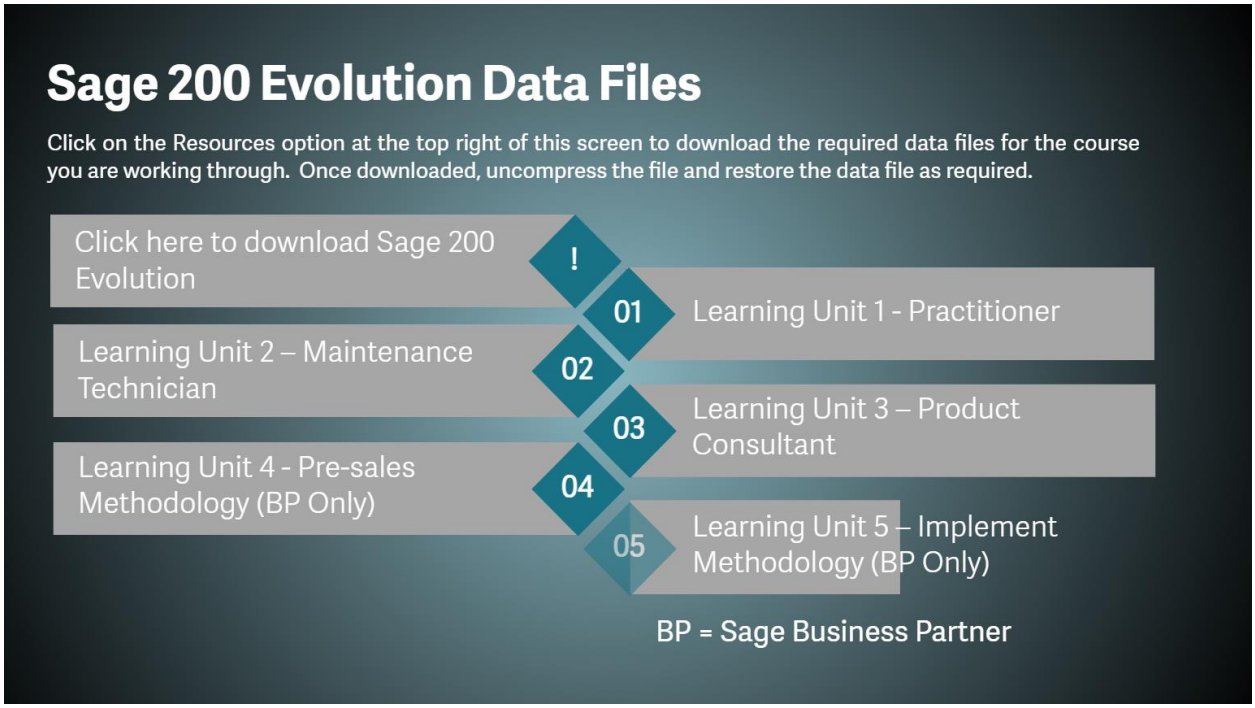
9. In the **Search** bar, enter **200EV – Sage 200 Evolution – Data Files** and hit **Enter** on your keyboard.
10. The following screen will display:



11. Select the file and click on the **Launch** button.
12. The following screen will display:



13. Click on next until the following screen displays:



14. Click on the first option to download Sage 200 Evolution.
15. The file will download to your downloads folder. Extract the file and the following will display.

Install Sage 200 Evolution

When you start running the installation, you have to choose between three options. This applies to each computer on which you select to install Sage 200 Evolution. The options are as follows:

Session:	Session Contents:
Complete	By selecting this option, all program features will be installed. This includes Freedom Service and GloveBox. This is the recommended option.
Typical	By selecting this option, most program features will be installed.
Custom	By selecting this option, you will choose which program features will be installed. This option will be recommended for advanced users.

The following steps explain the installation process:

Important information

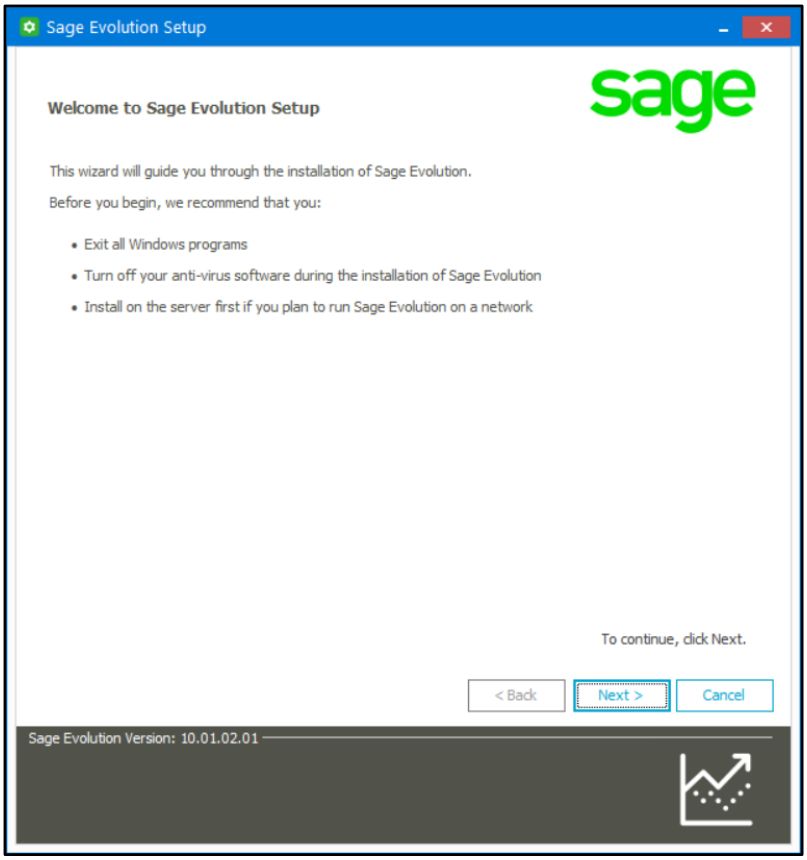
The screenshots might differ slightly, however the content and process should remain the same. The version number might differ as well.

Step 1

Download the system installation from the path instructed by the trainer and save the file on your local drive. Explore the downloaded file and double click on **Setup.exe** and the **Setup Wizard** will start.

Important information

To view the current system version number on the installation download, open SetupVer.ini using Notepad.



Make sure to follow the instructions to exit all Windows programs, turn off the anti-virus software to start the installation on the server machine if the installation is going to be on a network.

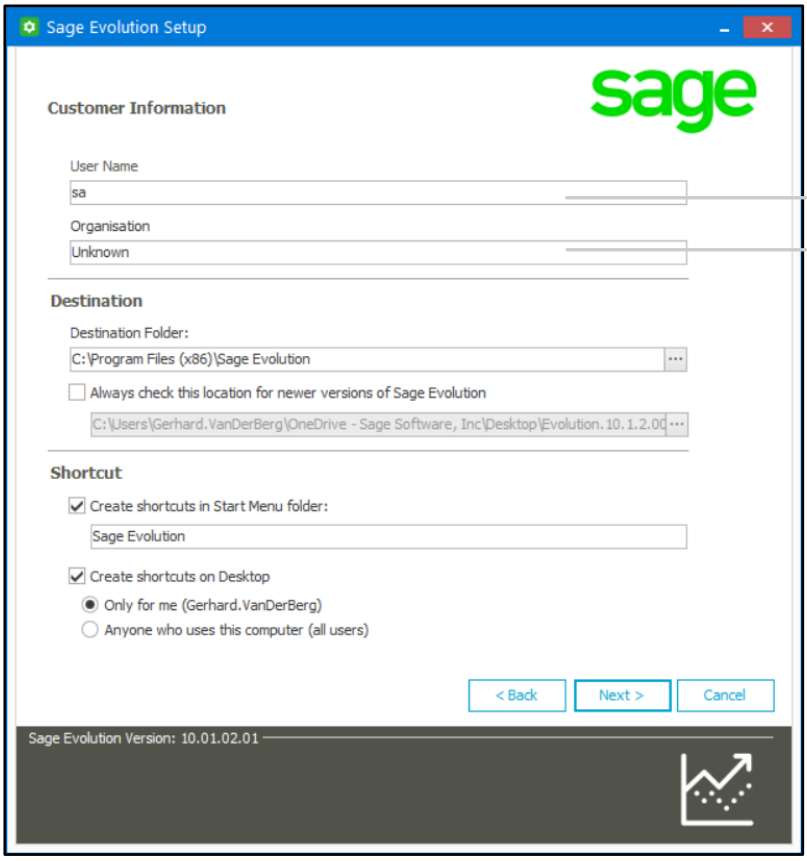
Click on the **Next** button.

Step 2

The following screen will display:

Customer Information

Enter your **User Name** and **Organisation** in the respective fields.



Enter your **User Name** and desired **Organisation** name in these fields.

The **Destination Folder** displays automatically. You can change the folder location in which you prefer to install Sage 200 Evolution. **We recommend you leave the default settings as they are.**

If you want each workstation to automatically install the updates, select the **"Always check this location..."** check box.

This works as follows:
Copy the entire installation into a folder that is accessible to all the workstations of Sage 200 Evolution. Specify this folder in the **Destination Screen** by selecting the **"Always check this location..."** check box and entering the name of the folder in the specified field. When you receive updates for the system program, close all open versions on each workstation. In this folder that you have set up for the installation, delete the contents you copied previously and copy the new version files into this location. The next time users open the system over the network, an automatic installation of the new version will take place.

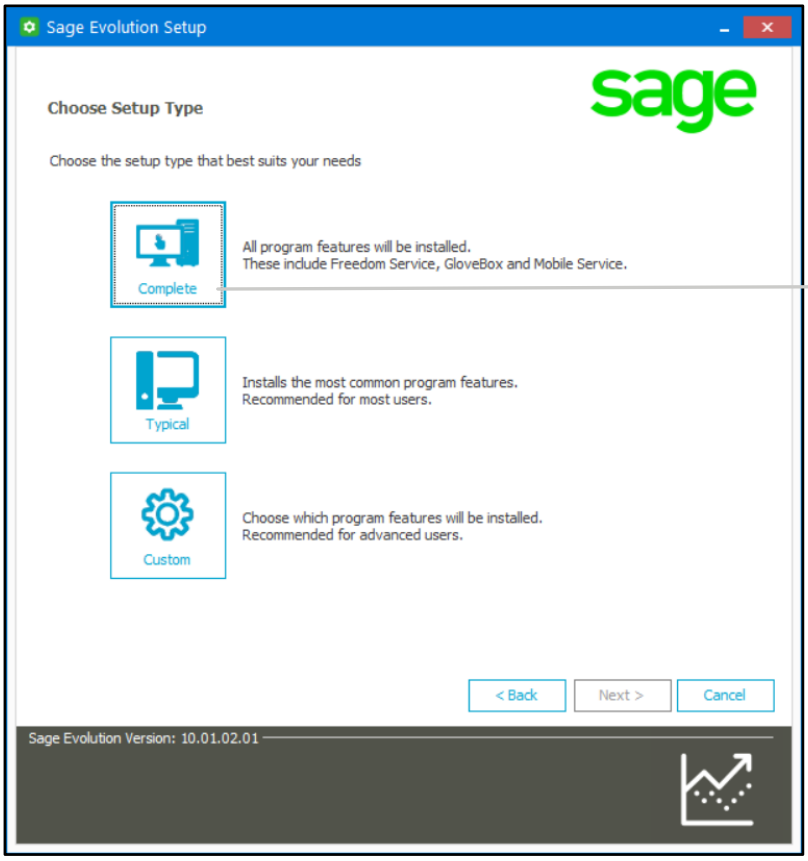
Decide whether to create a shortcut in the start menu folder and on the desktop for all users or for yourself as the person doing the installation on the computer. These options are selected by default and can be unselected.

Click on the **Next** button to continue.

Step 3

The following screen will display:

Select the required installation type by selecting the relevant option.



Select the **Complete** option for this course.

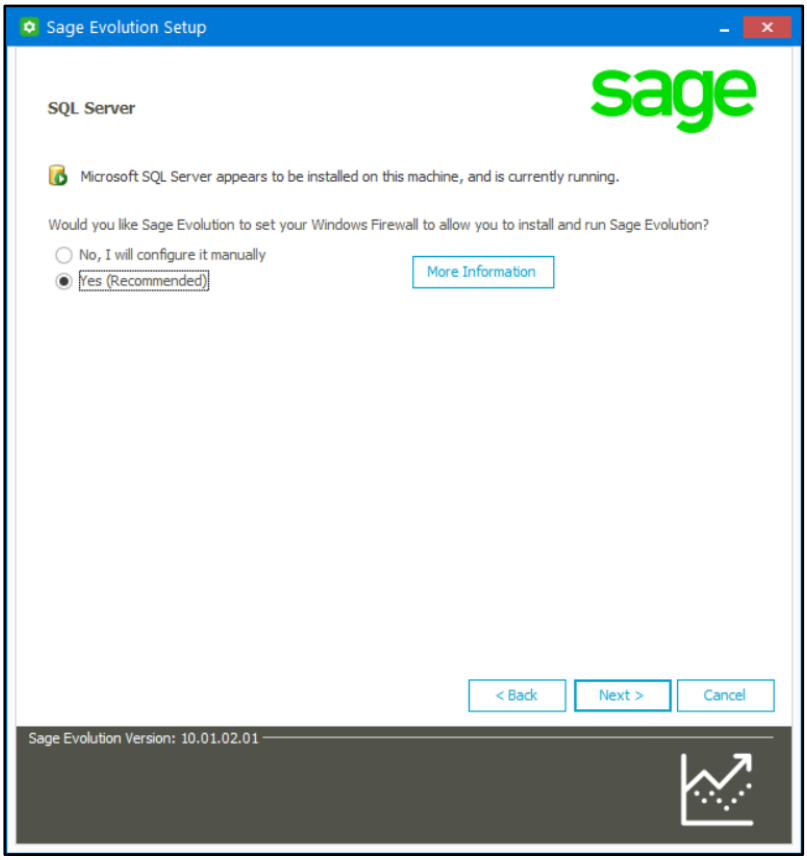
The recommended option is **Complete** which installs all the program features.

Click on the **Next** button to continue.

Step 4

The next screen is to install Microsoft SQL Server Express and it checks if you have MS SQL installed already.

If Microsoft SQL Server Express is installed on the computer, the following screen will display:



Alternatively, if Microsoft SQL Server Express is not installed you will be prompted to install it.

If you are installing on a workstation, you will deselect this check box and not install Microsoft SQL Server Express as Microsoft SQL Server Express must only be installed on the server computer.

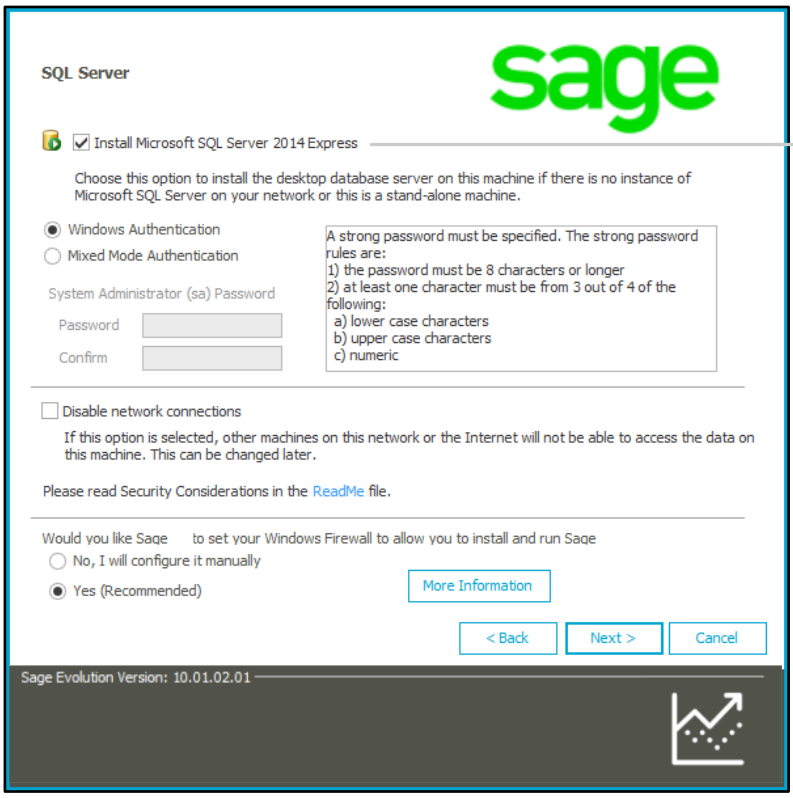
Important information

You need to install MS SQL Server Express on one computer only, and only if it is not installed.

Microsoft SQL supports two authentication types / models. The table below explains the two available options:

Authentication Type	Explanation
Windows authentication (default)	**This type of security uses the Windows principal token from the user's operating system to create trusted connections from the system to the SQL database. The connection is made using the user's Windows account details. The user requires a username and password when accessing the SQL database on the server.**
Mixed Mode Authentication	**This type of security uses login details created in the SQL Server and is not linked to Windows user accounts. Each time the user connects to a SQL Server database they must provide a login name and password.**

If you are going to connect in a multi-user environment, make sure the option **Disable network connections** is unselected and for a single user environment make sure the option is selected.



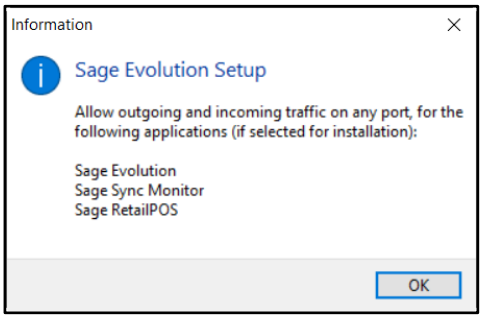
If the system detects that you do not have SQL installed on your computer, this option will be enabled.

Important information

It is recommended not to disable network connections unless it is a specific requirement in your environment.

Select the option to allow the system to set the Windows Firewall to allow you to install and run the system.

When you click on the **More Information** button, the following information screen displays.



This screen only provides additional information regarding which ports will be opened for the installation to go through.

Click on the **OK** button to close the screen and select **Next** to continue.

Step 5

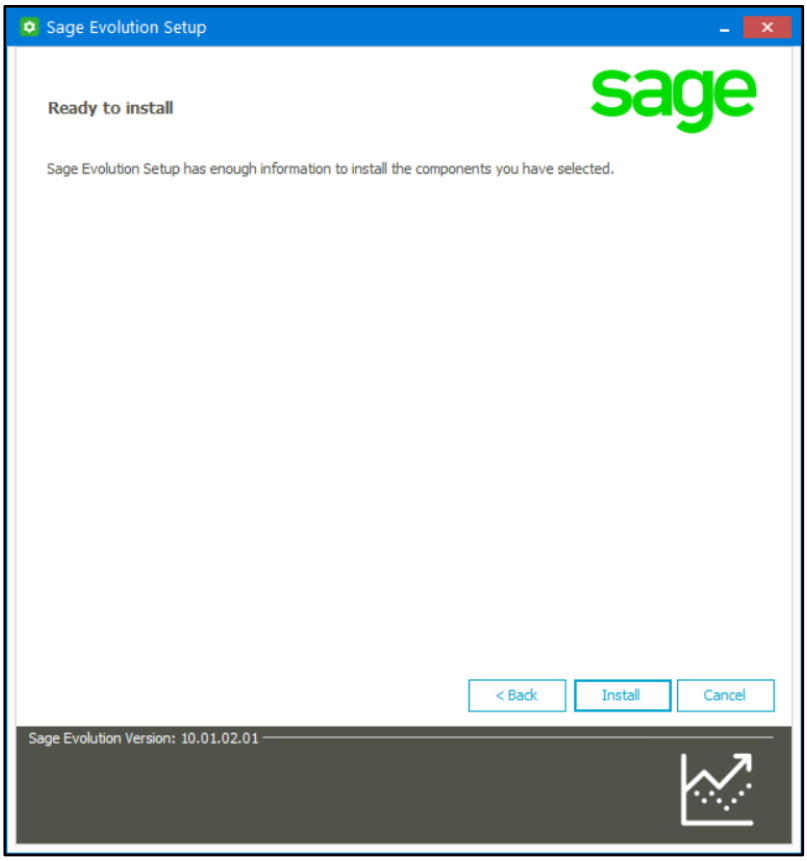
Read the license agreement and select the "**I Agree...**" option if you wish to proceed with the installation. Click on the **Next** button to continue.

Step 6

Read the Sage Intelligence Centre End User Licence Agreement and select the "**I Agree...**" option if you wish to proceed with the installation. Click on the **Next** button to continue.

Step 7

You are now ready to install. Click on the **Install** button to continue.



Important information

Please be patient while the MS SQL Server prerequisites install. This might take a few minutes.

The system will automatically detect which prerequisites of MS SQL Server have to be installed.

The prerequisites are:

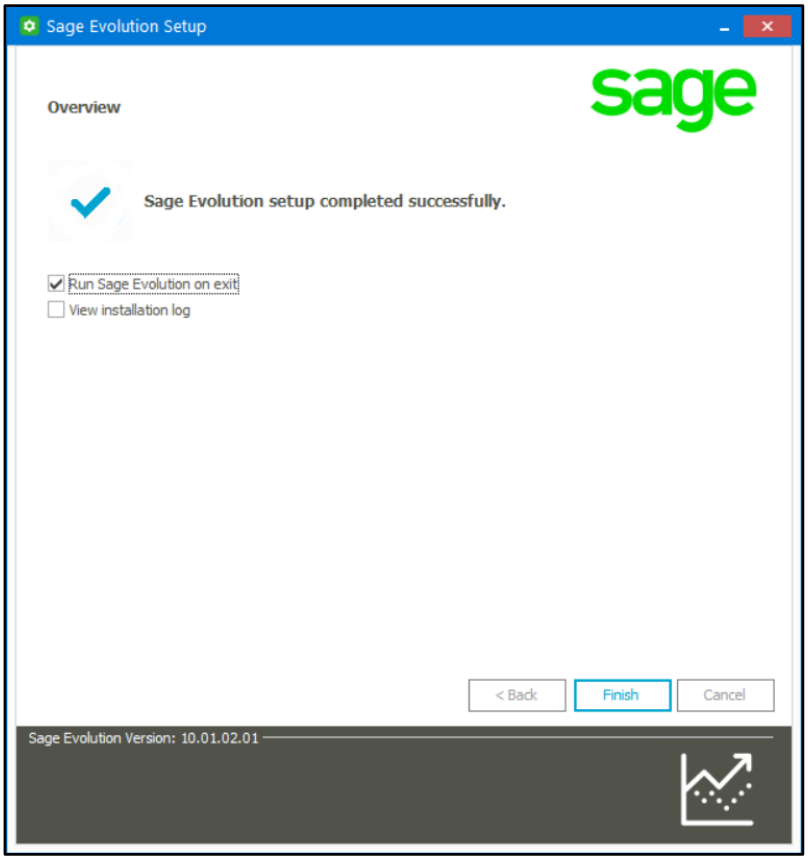
- Windows Installer 4.5
- Microsoft .Net Framework 4.5
- Windows PowerShell 3.0 or higher

All these applications can be found on the system installation download:

Folder	File name
DOTNETFramework	dotnetfx35.exe
Powershell	Windows PowerShell 3.0

Step 8

A message displays, notifying you that Sage 200 Evolution was installed successfully and when you click on the **Finish** button, Sage 200 Evolution will open if the **Run Sage Evolution on exit** option is selected. Alternatively you can restart the machine to refresh the installation settings.



Important information

Once the installation completes, it is advisable to restart your computer to ensure all the installation settings were saved correctly. This will clear your "temp folder" which will improve your computer's speed.
